PROFILE

I am a highly determined and creative Games art graduate. As an environment artist for the past 5 years I have developed a wide variety of skills in game production. Alongside industry standard skills I am a hard-working and collaborative individual with a keen interest to learn more and improve my skills as a proficient 3D environment artist.

Employment

06/2022 - 06/2023

Before starting university I worked a variety of different jobs whilst I was attending college. These jobs included kitchen staff at KFC, bar staff at White horse Pub and a retail assistant at Trespas. These jobs ultimately allowed me to gain transferable skills into the games industry including communication, collaboration and problem-solving. Throughout the course of my time at University I have not worked any other jobs due to focusing on my studies.

EDUCATION

BA (Hons) Games Art - Grade: TBC

09/2023 - 06/2026 Teesside University

Modules include:

- Final Year Project
- Photogrammetry
- Beta arcade
- Hard surface modelling
- The Journeyman Project
- Character production
- Games technical art
- Environment production for games
- Sculpting for games
- Asset creation for games
- Games art fundamentals

SKILLS

3D Art, PBR texturing, Hard-surface modelling, World building, Lighting, Rendering, Low-Poly modelling, Shaders, Texturing, Set dressing, Visual Storytelling, Photogrammetry, Sculpting, Prop modelling, Texture baking, UV mapping, Retopology

SOFTWARES

3ds Max, Maya, Unreal Engine 5, Unity, Blender, Substance Painter, Substance Designer, Substance Sampler, Zbrush, Photoshop, Marmoset Toolbag, Reality Capture, Agisoft Metashape, GitHub

KEY PROJECTS

Final Project - THE-VAULT (environment)

Created a 3D environment within Unreal Engine 5 using Maya, Substance Painter, Substance Designer and Photoshop. I created a real-time replication of 'Vault 76' from Fallout 76. This project included a bedroom, living room, utility area and corridor. Using industry standard practices I was able to develop a fully playable 3D environment some of the skills I was able to develop included: modular workflows, shader creation and high to low poly baking. The final deliverable of this project was a fully rendered cinematic sequence of the scene available on my portfolio.

Journeyman (cross discipline team)

University group project where I collaborated with a team of artists, designers and programmers. I was an environment artist working with the team to develop high quality assets and work directly in the engine using GitHub to help with building the world. The project was a Sly Cooper themed Astro Bot level. Our team was the winning team at the end of the project, creating the best functioning and visually appealing game out of 12 teams.

Beta Arcade (cross discipline team)

Second University group project. This project became a valuable experience of how to overcome the challenges and difficulties created by a team that lacks communication. The aim of this module was to create a game with no limitations. The team had difficulties with communication, so I had to take lead of the artists within the team to ensure we still provided high quality assets. Unfortunately, I was unable to access the game files to ensure these assets were being used throughout production. I still passed the module with a high grade.

INTERESTS

- Playing games & creating environments and assets based on my favourite games to experiment with different art styles and industry standard techniques.

- Annual attendance at Animex and other game events (Games event) to keep up to date with changes in the games industry and network with industry professionals.

- Other discipline unrelated interests include HTML, cinematography and technical art.
